ABSTRACT OF THE DISCLOSURE

A printing device, including at least one electrophotographic printing unit with a transfer medium for the transfer of a toner powder to a substrate in a transfer zone. One or several substrates may be run through the transfer zone by a transport system. The transport system includes a heated housing device for each substrate, having one or several heating elements for the introduction of heat energy into the substrate. A cooling device is provided for the transfer medium of each printing unit, which extracts heat energy from the transfer medium. There can be a number of serially arranged printing units, for the printing of each substrate, each with a different color.
